ROHIT AI STUDIO

Your business, in motion.

A practical guide to the dashboard: what each area does, how to try it safely, and how a real business can use it day to day.

Your screenshot: the Overview page in Trial mode. Counts and examples vary with your workspace data.

FEATURES · WORKFLOWS · REAL-WORLD EXAMPLE

OCTOBER 2026

START HERE

What this dashboard is for

Rohit AI Studio brings customer conversations and everyday business follow-up into one workspace. It combines a customer list, lead pipeline, inbox, bookings, offer catalog, AI configuration, automations, and communication tools.

The important difference: Trial and Live

TRIAL is a safe practice environment. Messages and calls are simulated inside the app; Trial AI is a local preview. Nothing is sent to a real customer's WhatsApp, phone, SMS, or inbox, and no paid AI provider is needed.

LIVE sends through real, configured providers for that organization. Only an authorized platform super-admin can activate it, after confirming setup and plan status. A missing or failing real provider is an error—not a pretend success.

One workspace at a time

Each business has its own contacts, leads, conversations, offers, settings, Trial/Live mode, and provider sender details.

One practical routine

Set up business facts, add offers and contacts, practice a conversation, record opportunities, and review the next action.

Current product boundary: Trial is for learning the screens and message flow, not for verifying a real-world AI booking or contacting actual customers. Some advanced actions, especially AI tool-based booking, require a correctly configured Live AI workflow.

This guide describes the current implementation. It does not promise online checkout, automatic billing, or that every listed provider is already connected.

GET INTO THE APP

Run it on your computer

For local development, PostgreSQL, the API, and the Next.js website need to be running. Open two Terminal windows and keep both open.

Terminal window 1 — database and backend

```
cd "/Users/rohitmehra/Downloads/buisness ai/backend"
docker compose up -d
npm run dev
```

Terminal window 2 — website

```
cd "/Users/rohitmehra/Downloads/buisness ai/frontend"
npm run dev
```

Open these local pages

Dashboard: **http://localhost:3000/**
Public workshop sales page: **http://localhost:3000/workshop**

These are local addresses on your computer, not public internet links. Other people cannot access them until the app is deployed to hosting with a domain.

Load a ready-made demo business

```
cd "/Users/rohitmehra/Downloads/buisness ai/backend"
npm run seed
```

Then sign in to the dashboard using `owner@urbanfit.demo` and `demo12345`. This is a local development account only. Never use these credentials for a public site.

First time setup: if your project has not been installed/configured on this computer yet, follow the root `README.md` first to prepare `backend/.env`, install dependencies, generate Prisma, and apply migrations.

THE LEFT NAVIGATION

Every dashboard area

Menu item	What you use it for	Example
Overview	At-a-glance activity, open conversations, leads, bookings, revenue totals, and shortcuts.	See whether new enquiries need attention.
Conversation desk	Review the workspace inbox, open a customer thread, reply, reopen AI, take over, or resolve.	Take over when a customer has a complaint.
Lead pipeline	Track prospects through stages such as New, Contacted, Qualified, Proposal, Negotiation, Won, and Lost.	Move a qualified prospect to Proposal.
Contacts	Store customer name, phone/email, company, and tags in the current workspace.	Find a returning customer before replying.
Appointments	View appointments created by supported AI booking flows.	Check the calendar after a Live AI booking.
Offer library	Maintain products/services with price and duration, used as business reference.	Add a 60-minute consultation at ₹1,500.
AI agents	Set up named AI assistants, their instructions, and a default active agent.	Define a polite enquiry-handling assistant.
Automation engine	Build event-triggered workflows and inspect whether each run succeeded or failed.	When a lead is created, send a welcome message.
Channels & calls	Check channel readiness; send a tracked message or start a demo/live voice call.	Practice a WhatsApp message in Trial.
Business setup	Enter business facts and AI instructions. A configured platform super-admin also sees organization Trial/Live controls.	Explain opening hours and cancellation policy.

The dashboard's labels are intentionally kept consistent across modes; a small Trial/Live marker tells you which behavior the workspace will use.

CUSTOMER OPERATIONS

Contacts, leads & conversations

Contacts: your customer record

1. Open **Contacts** and choose **Add contact**.
2. Enter the customer's name and the phone/email address you will use. Add a company and useful tags if relevant.
3. Save, then use this record in channel messaging, the lead pipeline, or a conversation.

Leads: a possible sale that needs follow-up

Create a lead from an existing contact, then move it through the pipeline as the relationship progresses. Add truthful source/value details and update the stage after real conversations.

Example stages: New → Contacted → Qualified → Proposal → Won (or Lost). “Won” is your team’s tracking status; it is not a payment processor.

Conversation desk: the customer thread

- Open a thread to review its messages and contact details.
- Use **Take over** when a human should handle the issue; AI should stop talking over an escalated conversation.
- Use **Reopen AI** to hand an open thread back, or resolve it when finished.
- In Trial, a reply is stored as a demo and is not delivered externally. In Live, it uses the configured channel provider.

Privacy habit: add only information your team needs. Workspace records are scoped so users see data only in workspaces where they have active access.

TEACH THE SYSTEM

Offers, AI agents & automations

1 · Add accurate offers

In **Offer library**, add the real service name, price, duration, and a short description. The AI uses active offers as business facts. Keep prices and policies up to date; do not expect it to know facts you have not supplied.

2 · Give an agent a clear job

In **AI agents**, create an agent and write instructions about role, tone, service facts, boundaries, and when to escalate. Set one active agent as default. Be explicit: “Do not promise a slot until availability is checked. Escalate billing disputes to a human.”

3 · Automate repeatable follow-up

In **Automation engine**, choose a trigger, optional condition, and action. Current triggers include lead created, customer message received, and appointment booked. Actions include sending a WhatsApp/SMS/email message or updating a lead stage. Templates can use data such as `{{contact.name}}`.

After an event fires, inspect **Recent runs**. Failed runs show an error; do not assume an automation worked just because it was saved.

Trial note: Trial AI replies are local previews and don't call the external AI or booking tools. Use Trial to learn the interface and test demo message recording. A confirmed AI booking or live follow-up depends on Live provider setup and a supported workflow.

SAFE PRACTICE

What happens in Trial mode?

Trial mode lets you practice without paying for or configuring communication APIs. It records demo activity in the workspace so you can see how the interface behaves.

Feature	Trial behavior	Live behavior
WhatsApp, SMS, email	Saved as simulated demo messages; no customer receives them.	Sent using the configured real provider; missing setup returns an error.
Voice	Creates a demo call record; browser may speak a short demo notice. It does not dial a phone.	Places a real configured provider call; requires a public webhook URL.
AI	Local preview response; no AI key needed; it does not execute booking/lead tools.	Configured real AI provider can drive the supported assistant flow.
Contacts and pipeline	Workspace database records. Use fictional/sample people while practising.	Same screens and records; handle real personal data responsibly.
Automations	Can be practiced; outgoing actions remain simulated while workspace is Trial.	Configured actions may contact customers through real providers.

Default trial controls

Current defaults are configured centrally and can be adjusted by a super-admin: 14 days, up to 100 WhatsApp demo messages, 100 SMS demos, 50 email demos, 30 voice demos, and 3 users. Enabled feature areas can also be configured per workspace.

The control panel can change trial limits. Automatic payment, plan renewal, and automated Trial-to-Live conversion are not implemented.

EXAMPLE BUSINESS

Real-life example: a fitness studio

Imagine “UrbanFit Studio” receives enquiries about personal training. The owner wants to avoid missing interested prospects and keep a consistent record of each conversation.

1 Set up facts first

In **Business setup**, enter UrbanFit's name, hours, location, and rules. Write accurate AI instructions: session length, prices, who can book, cancellation policy, and when to ask a human.

2 Add the service

In **Offer library**, add “Personal training consultation”, ₹1,500, 60 minutes, and a clear description. Verify this is the current price.

3 Practice safely

Use the Trial WhatsApp simulation (for example, from the Overview card or the Conversation desk) with a fictional name and number. Enter: “Hi, I want to know about personal training.” The conversation and demo response appear in the inbox. No WhatsApp is sent.

4 Record the opportunity

Add the fictional person as a contact. Create a lead for that contact and move it from New to Contacted after your team follows up. Use the conversation desk to practice a human reply or escalation.

5 Review what needs attention

Use Overview for new leads/conversations; scan the lead pipeline; resolve a thread only when follow-up is complete. Review automation runs for failures.

> **What this practice proves:** your team can navigate the dashboard, store a customer journey, test demo messaging, and agree on a follow-up process. It does **not** prove real delivery, provider connectivity, payment processing, or automatic booking.

Live activation: admin checklist

Do not switch a workspace to Live simply to make the indicator green. Live mode can send real messages or place calls. Verify the business has approved the setup and the exact providers first.

1. **Prepare the real provider setup.** A deployment administrator configures provider secrets securely in the backend environment. Each workspace also needs its own sender ID/number/address in the admin setup.
2. **Verify a plan.** Payment is currently collected outside the application. A super-admin records the applicable plan after manually confirming payment.
3. **Review readiness.** At least one real communication channel and a real AI provider must be configured. Test the sender in a safe, authorized way.
4. **Confirm activation.** In **Business setup → Trial → Live activation**, select the correct workspace, confirm the plan/provider setup, choose Live, and type the required confirmation phrase.
5. **Start small.** Have an authorized team member verify a permitted test recipient, channel, and message. Check its delivery status and provider result before expanding.
6. **Monitor and respond.** Check the inbox, failed delivery status, automation run history, and customer escalation. Human staff remain responsible for customer care.

Only a platform super-admin can change modes

Normal workspace owners/admins cannot activate their own workspace. The super-admin email must be listed in the backend's `SUPER_ADMIN_EMAILS`. Mode changes require explicit confirmation and are audit logged with previous mode, new mode, actor, and time.

Current limitations: payment is manual; there is no checkout flow. Provider API secrets are shared deployment environment settings, not encrypted per-customer credentials. Multiple sender identities per channel and automated subscription renewal are future work. If a Live provider is missing or fails, the system should show failure rather than silently simulate.

GOOD DAILY HABITS

A simple operating routine

Start of day

- Open Overview and look for conversations/leads needing attention.
- Check upcoming appointments.
- Assign clear ownership for follow-up.

During the day

- Add new contacts accurately.
- Update lead stage after a real customer interaction.
- Take over conversations requiring a human.

Before using AI

- Review prices and services in Offer library.
- Keep hours, policies, and escalation instructions current.
- Review agent instructions with your team.

Before Live sends

- Confirm workspace shows LIVE.
- Check provider readiness and recipient details.
- Inspect failed statuses and automation runs; correct problems promptly.

Quick fixes

What you see	What to check
Dashboard remains on "Waking up your workspace"	Confirm database/backend and frontend terminals are still running; check the API at `http://localhost:4000/api/health`.
Cannot sign in to the demo account	Run `npm run seed` in backend; check both services are available.
Live channel says not configured	Ask the deployment admin to check provider environment secrets and the workspace sender identifier. Do not put provider secrets in the browser.
A message shows failed	Read the visible error/status, verify recipient and provider configuration, then retry only when safe. A failed message is not a successful delivery.
Admin Trial/Live controls are missing	Only a signed-in email in backend `SUPER_ADMIN_EMAILS` sees platform controls.

Security reminder: change demo credentials before any shared deployment; use HTTPS, production secrets, verified email sender configuration, backups, and the launch checklist before inviting real customers.
